

Molecular and Synthetic Biology Solutions

Empowering the synthetic biology revolution
— from molecules to measurement

The Next-Generation of Molecular Biology

The foundational techniques of molecular biology are changing. Synthetic biology approaches to engineering biological systems and organisms have driven innovations in both DNA synthesis and assembly. Agilent's products bring these novel tools into the reach of every molecular biology lab, improving the speed and reliability while reducing the cost of next-gen cloning and mutagenesis.

Stratagene LABS. Agilent-Backed Quality.

Cutting-edge molecular and synthetic biology solutions to accelerate your research.

Since 1984, Stratagene products have been used throughout the academic, industry and government research sectors in fields spanning molecular biology, genomics, proteomics, drug discovery and toxicology. In 2007, Agilent Technologies integrated Stratagene's labs, which now form the primary research and development branch of Agilent's genomics division.

SureVector Next-Gen Cloning Kits

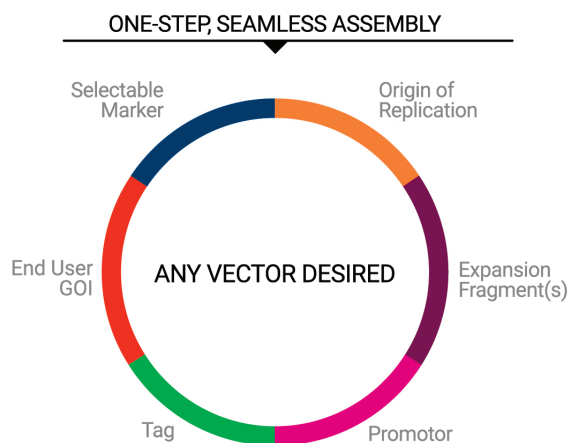

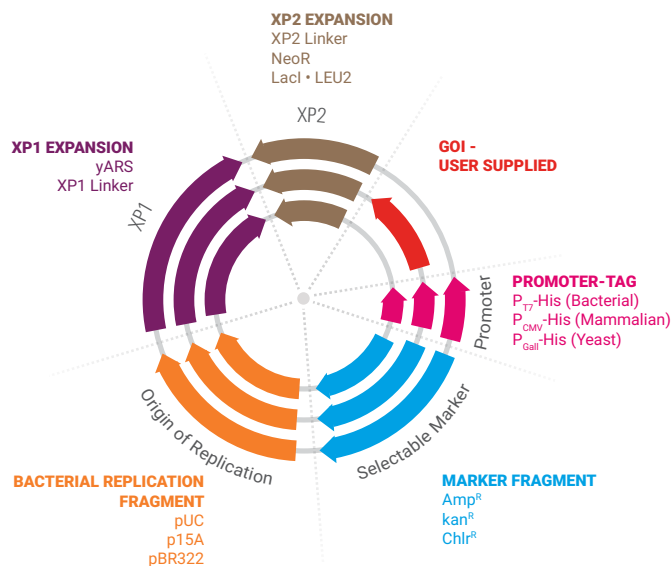

Your Vision. Your Vectors.

SureVector, the world's first modular vector system, harnesses the power of synthetic biology to provide quick, user-friendly customization of cloning and expression vectors. In contrast to alternative next-gen cloning technologies, SureVector offers a unique set of standard parts that can be assembled into an endless supply of custom vectors—all with a validated assembly system you can count on.

How does SureVector work?

A single SureVector kit contains a set of DNA fragments which are the functional "parts" of most cloning and expression vectors. These parts can be assembled into any combination desired, resulting in customized vectors. The proprietary SureVector enzymes can assemble up to seven fragments into a circularized plasmid in a single, 20-minute reaction.

Fast, Flexible, Reliable.

- **Rapid custom vector generation**
Less than a day from design to vector, compared to four weeks for custom vector services
- **Reliable and precise assembly**
SureVector is extensively validated to ensure standard parts can be interchanged without loss of functionality

- **More flexible than traditional systems**
Assemble new vectors in your lab as experimental requirements change, rather than ordering a new one
- **Control your experiments**
Take control of your experiments by troubleshooting your DNA assembly—not your service provider's

Multi-Organism Functionality

Bacteria

Bacterial expression using SureVector's T7 promoter. Pink colonies on the right express fluorescent protein when T7 is present, while negative controls (left) do not.

Yeast

The presence of LEU2 gene in the SureVector expansion slot (right) allows yeast to grow on leucine deficient media.

Mammalian

Stable mammalian cell lines using the neomycin resistant fragment from the SureVector kit.

Mutagenesis Products

Efficiency Without Compromise

From rational design to random mutations, Agilent offers mutagenesis solutions for any application. Agilent offers the only widely available commercial technology that is not PCR based, so you don't have to sacrifice error rate for efficiency.

Market-leading QuikChange Mutagenesis

QuikChange kits have provided researchers with a fast, easy and efficient non-PCR method to reliably perform site-directed mutagenesis since 1996. Other commercially-available kits utilize PCR-based techniques, which can propagate errors with each successive round of thermal cycling. The QuikChange method uses a linear amplification strategy with only the parental strand serving as the DNA template. Combining this with our highest fidelity polymerases leads to a significant reduction in unwanted second-site errors. The existence of such errors is likely to complicate and delay downstream screening and analysis.

QuikChange Lightning Multi

- Fast, reliable and easy QuikChange protocol
- Mutate up to three sites simultaneously using a single QuikChange reaction

QuikChange Lightning

- 75% reduction in thermocycling time compared to original QuikChange enzyme blend
- More efficient with improved colony yields
- >80% mutation efficiency for both short and long templates (up to 14 kb)

GeneMorph II

- More uniform mutational spectrum when performing error-prone PCR
- GeneMorph II kits utilize Mutazyme II DNA polymerase, a novel error prone PCR enzyme blend, with equivalent mutation rates at As and Ts vs. Gs and Cs

The 'Lightning Advantage'

The QuikChange Lightning Kit contains specially engineered enzymes that have been designed to shorten the time necessary to complete our signature 3-step protocol. Extension times for the thermal cycling process have been reduced by 75% and digestion of the non-mutated parental template has been decreased to only five minutes.

QuikChange Lightning Multi

- 1 Mutant Strand Synthesis**
Perform thermal cycling to:
 - Denature DNA template
 - Anneal mutagenic primers (all primers bind to the same strand)
 - Extend primers and ligate nicks with QuikChange Multi enzyme
- 2 Dpn I Digestion of Template**
 - Digest methylated and hemimethylated DNA with Dpn I
- 3 Transformation**
Transform mutated ssDNA into XL10-Gold ultracompetent cells, which synthesize the complementary strand

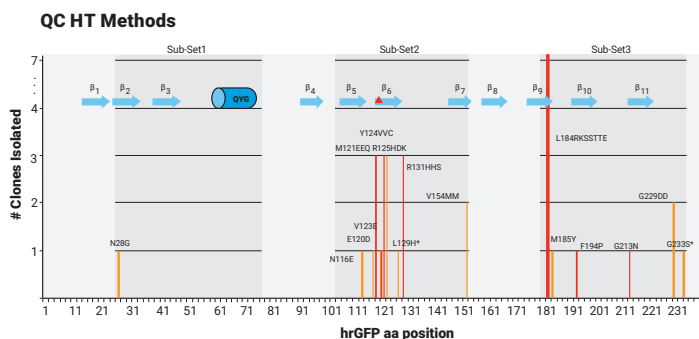

Mutagenesis Products (Continued)

QuikChange HT Protein Engineering System

QuikChange technology meets high-throughput DNA synthesis to provide access to rationally-designed oligo libraries for protein engineering applications. The QuikChange HT Protein Engineering System provides rapid resolution of structural and functional questions by creating libraries of rationally-designed mutants for applications such as single amino acid scanning, site saturations scanning or targeted combinatorial mutagenesis.

Key Features:

- Rapidly generate a rational design library of protein variants—less than a full day of hands-on time compared to weeks of waiting for a gene variant library
- Reduced cost of library generation—only pennies per mutant compared to \$20 or more for gene variant libraries

An example of the QuikChange HT kit applied to engineering of a GFP variant with enhanced brightness. Using site saturation mutagenesis yielded several beneficial mutations.

Use QuikScan1 to determine relevant stability: Separately replaces each amino acid in the wild type mutational region with a particular amino acid. Often used for Alanine scanning to quickly identify key functional or structural amino acids.

Use QuikScan19 to identify single codon replacements that improve binding, function or stability: Codon saturation scanning, systematically replaces each amino acid in the wild type mutational region with all 19 other amino acids, resulting in 19 mutagenic oligos for each amino acid position in the mutational region.

Use QuikCombine to discover a multisite mutant with improved structure, function and stability: Combine multiple mutants in groups of 1–4 position with defined variation at each site. Make up to 1.2×10^4 libraries for a single 50AA set or combine a few identified variants and validate functional relevance.

Three possible mutational strategies using QuikChange HT: Alanine-scanning, site saturation scanning and combinatorial mutagenesis.

Product	Uses	Part Number
QuikChange Mutagenesis		
QuikChange Lightning Multi	Use for up to 3 mutations simultaneously, 10 or 30 reaction kits	210514, 210516
QuikChange Lightning	Single site mutagenesis, 10 or 30 reaction kits	210518, 210519
QuikChange HT Protein Engineering System		
QuikChange HT	Use for targeting up to 10 different 50 amino acid long regions in a protein	G5900A
QuikChange HT	Use for targeting up to 20 different 50 amino acid long regions in a protein	G5900B
QuikChange HT	Use for targeting up to 10 different 67 amino acid long regions in a protein	G5901A
QuikChange HT	Use for targeting up to 20 different 67 amino acid long regions in a protein	G5901B
Random Mutagenesis		
GeneMorph II	Mutagenic polymerase for balanced random mutagenesis	200550, 200552

Specialty Cloning Products

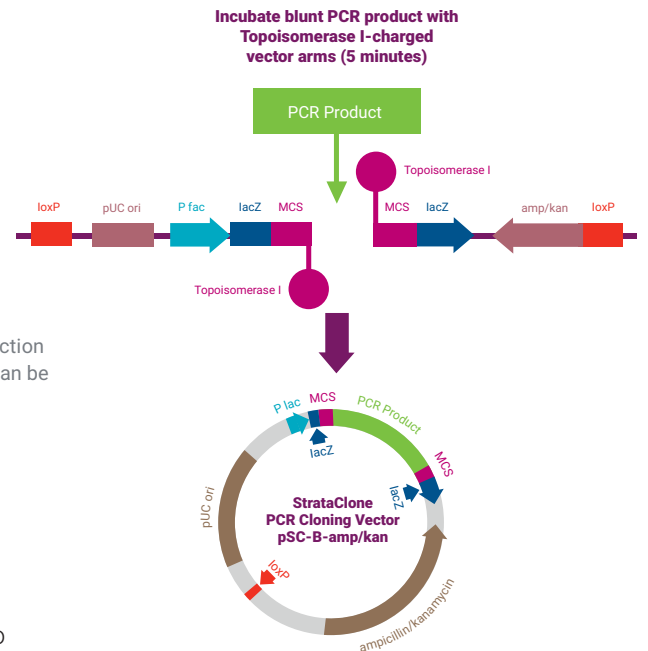

A Solution for Every Situation

When you have a difficult cloning project, Agilent offers everything from a traditional topoisomerase based kit to a huge selection of catalog vectors for any application.

StrataClone PCR Cloning Kit

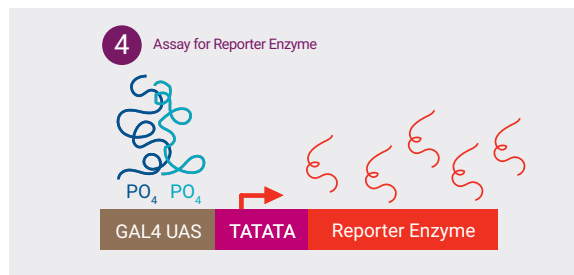

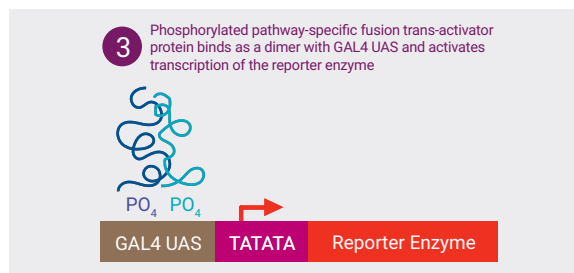

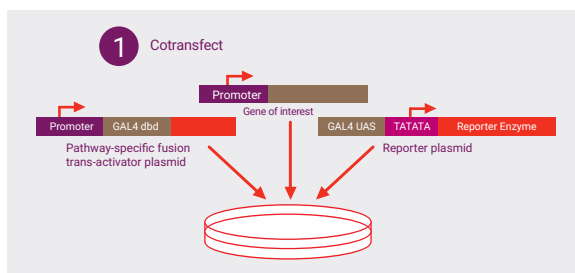

The StrataClone PCR Cloning Kit allows high-efficiency, 5-minute cloning of PCR products at room temperature, using the efficient DNA rejoining activity of DNA topoisomerase I and the DNA recombination activity of Cre recombinase. These kits are available for both blunt-end and UA cloning.

The blunt end StrataClone kit is perfect for use with our new Cas9 programmable restriction enzyme kit. Cas9 can be used to produce a linear fragment of DNA with blunt ends that can be rapidly cloned into the StrataClone vector.

PathDetect Cis and Trans-Reporting Systems

Determine if a gene product or compound activates pathways leading to specific enhancers with our PathDetect *Cis* and *Trans*-Reporting systems.

The PathDetect in vivo signal transduction pathway *trans*-reporting system.

Specialty Cloning Products (Continued)

InterPlay TAP Systems for Protein-Protein Interactions

The InterPlay Mammalian TAP System allows you to recover interacting proteins from mammalian cells. Tandem affinity purification yields your tagged protein and interacting proteins using gentle washing and small molecule elution conditions.

Two Easy Purification Steps

To purify proteins with the TAP protocol, apply the mammalian cell lysate to the streptavidin resin, then elute using biotin, and apply that eluate to a calmodulin resin. Once you elute with EGTA, you will get exceptionally clean proteins.

Specialty Vectors

SuperCos 1

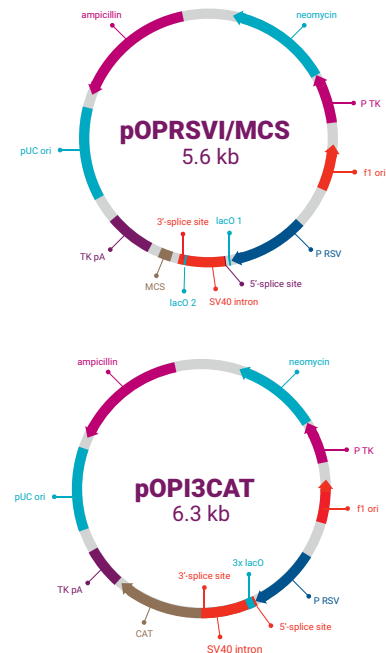

SuperCos 1 is a novel, 7.9 kb cosmid vector that contains bacteriophage promoter sequences flanking a unique cloning site.

We have a vector system for any application you could imagine—visit www.genomics.agilent.com

LacSwitch II

The LacSwitch II inducible mammalian expression system utilizes an improved vector system in which several elements of the lac operon have been modified for use in eukaryotic cells for inducible gene expression.

Viral Expression Systems

High-Efficiency Gene Delivery Starts Here

As synthetic biology moves out of the prokaryote and into eukaryotic systems, the need to study gene expression in a native host is becoming increasingly important. Many of these hosts are difficult or impossible to transfect, meaning progress may be limited by hosts that easily accept DNA using traditional transfection methods. To solve this problem, viral-based gene delivery systems have been developed for exceptionally high-efficiency gene delivery to a broader range of hosts.

Application	Long-Term Gene Expression	Transient, High-Level Gene Expression	Functional Cloning Assays
System	AAV Helper-Free System	AdEasy™ Adenoviral Systems	ViraPort Retroviral Expression System
Advantages	<ul style="list-style-type: none"> • Infects both dividing and non-dividing cells • Long-term, stable gene expression • Unparalleled biosafety profile 	<ul style="list-style-type: none"> • High-level protein production • Infects both dividing and non-dividing cells • Homologous recombination in <i>E. coli</i> saves weeks of work 	<ul style="list-style-type: none"> • Integrates into host genome for stable expression • Copy number controlled by multiplicity of infection • Functionally screen cDNA libraries in mammalian cells • Pre-made libraries available

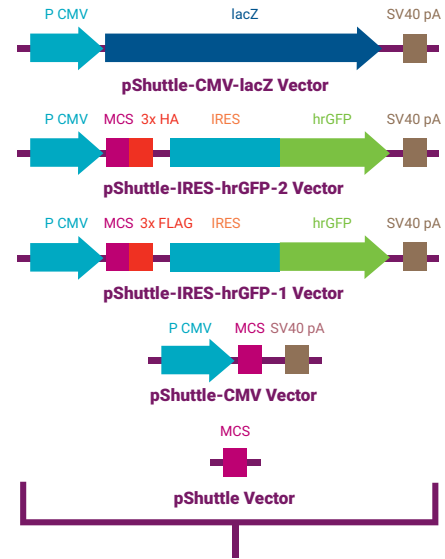

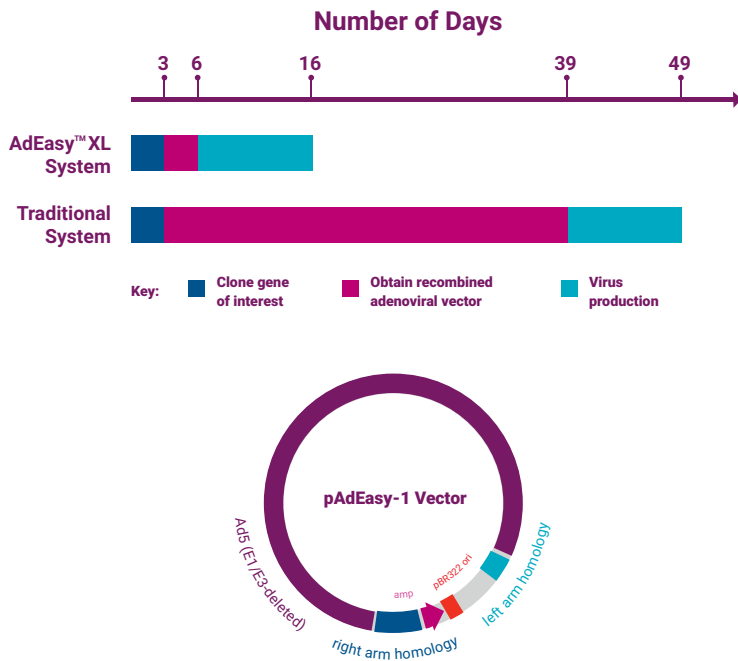

AAV Helper-Free

The AAV Helper-Free System improves upon recombinant adeno-associated virus-2 (AAV-2) technology by eliminating the need for helper virus. It allows safe, high-efficiency gene delivery and long-term expression in a broad range of hosts.

AdEasy™ XL and AdEasy™ Systems

The AdEasy™ XL and AdEasy™ Adenoviral Vector Systems save you a month of work over traditional methods by producing the recombinant adenoviral plasmid by homologous recombination in *E. coli*. Now you can obtain your recombinant plasmid after a simple transformation.

ViraPort

Our ViraPort retroviral gene expression system is superior to standard transfection technology. High transduction efficiency and large cloning capacity (up to 8 kb) make the system ideal for building and screening complex libraries.

Competent Cells

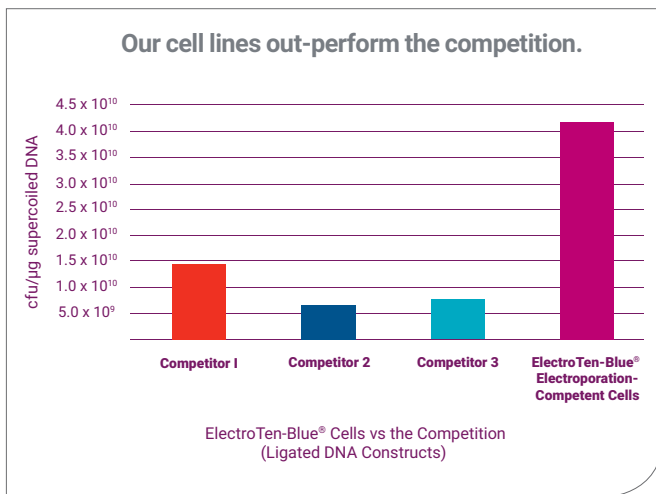

Explore a wider selection

Finding the right competent cells is easy with Agilent—we have a comprehensive selection of strains for all your next-generation cloning needs.

Cloning Cells

The Highest Efficiency

Our Ultracompetent Cells provide the highest transformation efficiency in the world, making it easier and faster to obtain an accurate clone. At Agilent Technologies, we understand the less time you spend worrying about cloning, the more time you can spend answering your research questions.

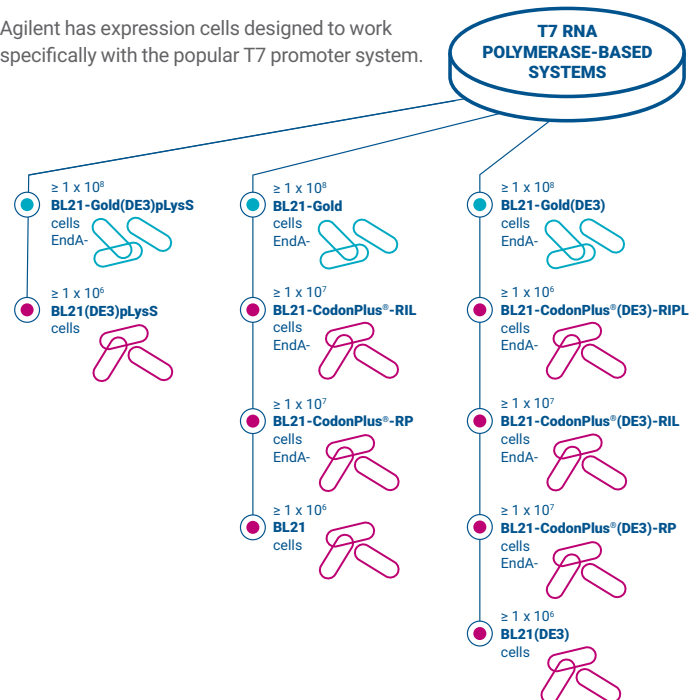

Expression Cells

The Widest Selection

We aren't content just to have the best competent cells. Agilent has designed strains for protein expression, plasmid stability, large plasmids and toxic proteins as well as everyday cloning. Our complete line of competent cells includes specialty cells for a huge variety of applications, each backed by Agilent's reputation for the best quality in the field.

Agilent has expression cells designed to work specifically with the popular T7 promoter system.

BL21-CodonPlus RIL Competent Cells	Eliminate codon bias, for non-T7 expression systems	$>1 \times 10^7$	Tetracycline and Chloramphenicol	230240
BL21-CodonPlus RP Competent Cells	Eliminate codon bias, for non-T7 expression systems	$>1 \times 10^7$	Tetracycline and Chloramphenicol	230250
BL21-CodonPlus (De3) RIL-X Competent Cells	Methionine auxotroph for x-ray crystallography	$>1 \times 10^7$	Tetracycline	230265
BL21-CodonPlus (De3) RP-X Competent Cells	Methionine auxotroph for x-ray crystallography	$>1 \times 10^7$	Tetracycline	230275
BL21-Gold	Increased efficiency and EndA-, use with toxic proteins and non-T7 systems	$>1 \times 10^8$	Tetracycline	230130
BL21-Gold (De3)	Increased efficiency and EndA-, use with non-toxic proteins	$>1 \times 10^8$	Tetracycline	230132
BL21-Gold (De3) pLysS	Increased efficiency and EndA-, use with toxic or non-toxic proteins	$>1 \times 10^8$	Tetracycline and Chloramphenicol	230134
BL21	Use with non-T7 systems or with lambda-CE6 for toxic proteins	$>1 \times 10^6$	Tetracycline	200133
BL21 (De3)	Use with non-toxic proteins	$>1 \times 10^6$	Tetracycline	200131
BL21 (De3) pLysS	Use with toxic or non-toxic proteins	$>1 \times 10^6$	Chloramphenicol	200132
XL1-Red Cells	For random mutagenesis	N/A	Tetracycline	200129
